

How to modify only one or two field(s) in LINQ projections?

```
(from s in EntityObj.UseList
 where s.id == id
 select s).ToList().ForEach(x => { x.login_id = "r";
x.mobile = "en"});
```

```
var List = EntityObj.UseList
```

Don't assign
the Query to
any
parameter.

After thw
query , assign
separately

```
users.ToList().ForEach(u =>
{
    u.property1 = value1;
    u.property2 = value2;
});
```
