WebApiConfig.cs

The key method for your here is the `EnableCrossSiteRequests` method.
This is **all** that you need to do. The `EnableCorsAttribute` is a globally scoped CORS attribute.

```
public static class WebApiConfig
{
    public static void Register(HttpConfiguration config)
    {
        EnableCrossSiteRequests(config);
    }

    private static void EnableCrossSiteRequests(HttpConfiguration config)
    {
        var cors = new EnableCorsAttribute(
            origins: "*",
            headers: "*",
            methods: "*");
        config.EnableCors(cors);
    }
}
```

Nrre to add one method to enable cors in wbapiconfig class

We can also add in api controller like below

```
[EnableCorsAttribute("http://localhost:51707", "*", "*")]
    public class CommunicationApiController : ApiController
    {

}
```
